```
physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acid at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New humanised antibody with affinity for vascular endothelial growth factor - for treatment of tumours, retinal disease and other angiogenic states, also related nucleic acid, vectors and transformed cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a variable heavy domain of an affinity-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Anti-VEGF humanised antibody variable heavy domain of variant Y0313-1
                                                                                                                       The present invention relates to a method for optimizing at least one

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                         physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; structure; selecting at least one amino acid to be considered at the variable position the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least one optimized physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing solubility, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody may be variable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                          present invention relates to a method for optimizing at least one
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                     Computer optimization of physicochemical properties of antibodies comprises analyzing the interactions of amino acids at variable positions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Computer optimization of physicochemical properties of antibodies

The present sequence represents a variable heavy domain of an affinity-matured anti-vascular endothelial growth factor (anti-VBGF) antibody variant. The sequence is used in the course of the invention to produce the humanised anti-VBGF antibody of the invention. The humanised anti-VBGF antibody of the invention. The humanised antibodies are used to inhibit VBGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinapathy). They can also be used to treat other conditions that involve angiogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc
                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The sequence is used in the course of the invention to produce the humanised anti-VEGF antibody of the invention. The humanised antibodies are used to inhibit VEGF-induced angiogenesis, particularly for treating or preventing tumours (of any type) and retinal disorders (e.g. age-related macular degeneration or diabetic retinopathy). They can also be used to treat other conditions that involve angiogenesis, e.g. rheumatoid arthritis, psoriasis, atherosclerosis, Grave's disease, etc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the heavy chain variable domain of the F(ab)-12 antibody variant Y0238-3. F(ab)-12 is a humanised anti-vascular endothalial growth factor (VEGF) antibody. F(ab)-12 was the parent artibody used in the production of a large number of antibody variants containing randomised peptide inserts within the complementarity determining regions (CDRS). Phage display libraries were subjected to eight rounds of selection to isolate variants with an antigen binding affinity at least two-fold stronger than the binding affinity of parent antibody for the target VEGF antibody. The anti-VEGF antibody variants may be useful in diagnostic assays for detecting expression of VEGF in cells, tissue or serum. They may also be used in the prevention and treatment of neoplastic diseases such as breast cancer, lung cancer and arthritis, psoriasis, atherosclerosis, and diabetic and other

The present sequence is the heavy chain variable region of the affinity matured anti-vascular endothelial cell growth factor (anti-VEGF) antibody CC TO (2014)—1. Humanised F(ab)—12 and affinity matured anti-VEGF antibodies may be used to treat conditions characterised by undesirable excessive neovascularisation. Such conditions include tumours (especially solid neovascularisation, such conditions include tumours (especially solid other retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, haemangiomas, thyroid hyperplasias (including Grave's disease), corneal and other tissue transplantation, and chronic inflammation. Oedemas associated with malignancies, meig's syndrome, head trauma, and ascites associated with malignancies, meig's syndrome, effusion, may also be traated Monoclonal antibodies are generated in hybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating edema, tumors, rheumatoid arthritis, psoriasis, atherosclerosis, diabetes and chronic inflammation in a mammal, comprises administering a human vascular endothelial cell growth factor antagonist.
YO243-1; vascular endothelial cell growth factor; VEGF; antibody; antiinflammatory; cerebroprotective; cytostatic; antifheumatic; antipariatic; antiarteriosclerotic; antidabetic; antithritic; antipariatic; antiarteriosclerotic; antidiabetic; antithrioid; excessive neovascularisation; tumour; rheumatoid arthritis; psoriasis; atherosclerosis; diabetes; retrolental fibroplasia; neovascular glaucoma; haemangioma; thyroid hyperplasia; grave's disease; tissue transplantation; inflammation; oedema; trauma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

CDR-H2

Treating edema, tumors, rheumatoid arthritis, psoriasis, atherosclerosis, diabetes and chronic inflammation in a mammal, comprises administering a human vascular endothelial cell growth factor antagonist. 99. .112 /label= CDR-H3 70. .79 /label= CDR-7 98US-00218481. 99WO-US029475 Van Bruggen N, Ferrara N; (GETH) GENENTECH INC WPI; 2000-442646/38.

The present sequence is the heavy chain variable region of the affinity matured anti-vascular endothelial cell growth factor (anti-VEGF) antibody (YO17). Humanised F(ab)-12 and affinity matured anti-VEGF antibodies may be used to treat conditions characterised by undesirable excessive neovascularisation. Such conditions include tumours (especially solid ones), rheumatoid arthritis, psoriasis, atherosoflerosofls, diabetes and cher retinopathies, retrolental fibroplasia, age-related macular degeneration, neovascular glaucoma, haemangiomas, thyroid hyperplasias (including Grave's disease), corneal and other tissue transplantation, and chronic inflammation. Ocdemas associated with tumours, strokes and head trauma, and ascites associated with malignancies, meig's syndrome, lung inflammation, nephroite syndrome, pericadial effusion and pleural effusion and pleural effusion and pleural offusion, may also be treated. Monoclonal antibodies are generated in hybridoma cells and those with affinity for VEGF are identified by immunoprecipitation or by an in vitro binding assay Disclosure; Fig 14B; 60pp; English.

The anti-VEGF antibodies are useful for inhibiting VEGF-induced angiogenesis in a mammal (particularly a human), particularly those having a tumour or retinal disorder e.g. intraocular neovascular disorders. The present sequence is an exemplary heavy chain variable domain of the humanised anti-VEGF antibody of the invention
                                                                                                                                                                                                                 Cytostatic; ophthalmological; humanised; antibody; anti-VEGF; VEGF; vascular endothelial growth factor; angiogenesis inhibitor; tumour; retinal disorder; intraocular neovascular disorder; Y0313-1; heavy chain; variable domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New humanized anti-VEGF (vascular endothelial growth factor) antibodies or their variants, useful for inhibiting VEGF-induced angiogenesis in a mammal, particularly for treating tumor or retinal disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDIUM TYPE: 3.5 inch, 1.44 Mb floppy disk COMPUTER: 11M PC compatible OPERATING SYSTEM: PC-DOS/MS-DOS SOFTWARE: WinPatin (Genentech)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        US-08-908-469-90

Sequence 90, Application US/08908469

Patent No. 6884879

GENERAL INFORMATION:

GENERAL INFORMATION:

Wells, James A.

Presta, Leonard G.

Lowman, Henry B.

COMPANIER OF INVENTION: ANTIBODIES

NUMBER OF SEQUENCES: 131

CORRESPONDENCE ADDRESS:

STREET: 1 DNA WAY
                                   Lownan, Henry B.

TITLE OF INVENTION: ANTI-VEGF ANTIBODIES
NUMBER OF SEQUENCES: 131

Total number of hits satisfying chosen parameters:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Producing an antibody or antigen binding fragment in high yield in a cell culture, comprises expressing a variable domain with a modified framework region in a host cell.

Claim 13; SEQ ID NO 19; 161pp; English.

The present invention describes a method for producing an antibody or antigen binding fragment in high yield in a cell culture. The method comprises expressing a variable domain of the antibody or antigen binding fragment comprising a modified framework region (FR) in a host cell, and recovering the antibody or antigen binding fragment variable domain comprising the modified framework from the host cell. The modified FR in the method described above has a substitution of at least one amino acid

us-10-764-428-19.rag

```
cc the amino acid found at the corresponding PR position of a human subgroup variable domain consensus sequence that has a hypervatable region 1 (HVR1) and/or HVR2 amino acid sequence that has a hypervatable region 1 (HVR1) and/or HVR2 amino acid sequence with the most sequence identity with a corresponding HVR1 and/or HVR2 sequence of the variable domain.

CC The antibody or antigen binding fragment variable domain comprises the modified antibody or antigen-binding fragment. The antibody and antigen binding fragment to antibody and antigen binding fragment are useful for cumodified antibodies or antigen-binding fragment. The antibody and antigen binding fragment invention are useful for methods and compositions of the present invention are useful for producing antibodies or antigen binding fragments in cell culture, in conditing fragments in cell culture. The antibodies of the invention can be used to diagnose, treat, inhibit or prevent e.g. tumours and composition and immunological disorders. The present sequence represents a heavy chain HVR1 peptide of an anti-VEGF (vascular cendothelial cell growth factor) antibody, which is used in the central invention.
                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Improving affinity of polypeptides, particularly anti-IgB antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the

This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgB antibody activity. The antibody has improved action due to a process comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgB (immunoglobulin B) antibody; b) substituting alternative residues to create candidate molecules, and c) substituting alternative residues to create candidate molecules, and c) caspacing those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiasthmatic; antiallergic, ophthalmological; dermatological and antiinflammatory activity. The antibodies are useful for treating IgB-mediated disorders such as sathma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned concletc acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Anno acid sequences AAB76936.

AAB76960 represent fragments of anti-IgB antibodies of the invention. Polymucleotide sequence AAF69253 represents an expression plasmid used in the generation of affinity improved anti-IgB antibodies
                                                                                                                                                                                                                                                                                                                                                                                                 Antibody, antiasthmatic, antiallergic, ophthalmological, dermatological, antinflammatory, Ig B, immunoglobulin B, asthma; allergic rhinitis, conjunctivitis, eczema; urticaria, food allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid encoding anti-immunoglobulin B antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin E prone to isomerization by other residues by affinity
                                                                                                                                                                                                                                                                                                                            Variable heavy chain sequence of e25, e26 and e426 SEQ ID 12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      100.0%; Score 64; DB 4; Length 114; 100.0%; Pred. This invention relates to a nuclectide sequence encoding an antibody with improved anti-IgE antibody activity. The antibody has improved action due comprising, a) identifying aspartyl residues prone to isomerisation in unimproved anti-IgE (immunoglobulin E) antibody; b) substituting alternative residues to create candidate molecules, and c) selecting those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiasthmatic; antiallargic; ophthalmological; dermatological and antiinflammatory activity. The antibodies are useful for treating IGE-mediated disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned nucleic acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Amino acid sequences AAB76936.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polynucleotide sequence AAF69253 represents an expression plasmid used in the course of the invention, and oligonucleotides AAF69254 - AAF69271 are used in the generation of affinity improved anti-1gB antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Anti-1gB antibody e25, e26 and e426 variable heavy chain domain (VH).

                                                                                                                                                                                                                                                                                                                                                                                                        New composition of an improved anti-IgE antibody or IgE binding fragment, useful for treating IgE-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to therapeutic compositions comprising anti-IgE antibody or IgE binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgE-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity and asthma, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is an anti-IgE antibody variable heavy chain domain (VH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "CDR (Complementarity-determining region)-ni"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition of an improved anti-IgE antibody or IgE binding fragment, useful for treating IgE-mediated diseases, e.g. atopic allergy, asthma, conjunctivitis, eczema, urticaria or food allergies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to therapeutic compositions comprising anti-IgE antibody or IgE binding fragment in combination with an adjunct immunosuppressive agent. The composition is useful for treating IgE-mediated disorders. The disorders include atopic allergy associated with anaphylactic hypersensitivity and asthma, allergic rhinitis and conjunctivitis, eczema, urticaria and food allergies. The present sequence is an anti-IgE antibody variable heavy chain domain (VH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-IgB antibody; immunosuppressive agent; IgB-mediated disorder; therapy; atopic allergy; anaphylactic hypersensitivity; asthma; allergic rhinitis; conjunctivitis; eczema; urticaria; food allergy; variable heavy chain domain; VH.
 Anti-IgB antibody, immunosuppressive agent, IgB-mediated disorder; therapy, atopic allergy; anaphylactic hypersensitivity; asthma; allergic rhinitis; conjunctivitis; eczema; urticaria; food allergy; variable heavy chain domain; VH.

                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinlis, eczema, utticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the human anti-IgB antibody e26, e27 and e426 variable heavy chain protein.
                                                                                                                                                                                                                                            Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 64; DB 9; Length 114; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chemotherapy, IgB-mediated disorder; asthma; allergic rhinitis; eczema; urticaria; food allergy; hypersensitivity; anaphylactic hypersensitivity; antiasthmatic; antiallergic; dermatological; antibacterial; minemune disorder; inflammation; ear disease; nose disease; throat disease; respiratory disease; antiinflammatory; dermatological disease; immunosuppressive; antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for treating an IgB-mediated disorder. The method involves administering a therapeutical amount of an anti-IgB antibody or its IgB binding fragment. The invention is useful for treating an IgB-mediated disorder e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies and hypersensitivity e.g. anaphylactic hypersensitivity. The present sequence is the human anti-IgB antibody e27 heavy chain variable region protein.
                                                                                                                                                                                                                                                                                                                                                              Treating an IgB-mediated disorder, e.g. asthma, allergic rhinitis, eczema, urticaria, food allergies, or hypersensitivity, by administering an anti-IgB antibody or its antigen-binding fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human anti-IgB antibody e26, e27 and e426 variable heavy chain protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention relates to compositions comprising a carrier, a first active agent comprising non-glucocorticoid steroids or their salts and a second active agent comprising an anti-immunoglobulin B (IgE) antibody effective to treat asthma, chronic obstructive pulmonary disease.

The compositions are also useful for reacting pulmonary disease. The compositions are useful for respiratory, lung/malignant disorder/condition such as asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspme, emphysema, chronic obstructive pulmonary hypertension, quilmonary pulmonary diseases, cystic fibrosis, dyspme, emphysema, chronic obstructive pulmonary diseases, cystic fibrosis, dyspme, emphysema, chronic constructive pulmonary hypertension, quilmonary binonchoconstriction, crespiratory tract inflammation or allergis, bronchoconstriction, difficult chapting, impeded or obstructed lung airways, adenosine test for cardiac function, pulmonary vasoconstriction, impeded respiratory distress syndrome, administration of adenosine creating, cancer or chronic bronchitis, and for reducing levels largic rhinitis, cancer or chronic bronchitis, and for reducing levels incaring an allergic rhinitis, cancer or chronic bronchitis, and for reducing levels incaring an allergic rhinitis, cancer or chronic bronchitis, and for reducing levels incaring an allergic rhinitis or adenosine or adenosine cest for cardiac incared anti-IgE antibody CDR domain, used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antiasthmatic; Respiratory-Gen.; CNS-Gen.; Hypotensive; Antiinflammatory; Antimicrobial; Antiallergic; Cardiant; Analgesic; Vasotropic; asthma; chronic obstructive pulmonary disease; respiratory disease; pulmonary disease; respiratory disease; pulmonary disease; cystic fibrosis; dyspnea; emphysema; pulmonary hypertension; pulmonary fibrosis; hyperresponsiveness of the airways; infectious diseases; respiratory tract inflammation; chronic bronchitis; respiratory distress syndrome; pain; allergic rhinitis; cancer; immunoglobulin E; IgE; antibody; antibody therapy.
             Composition used for treating e.g. asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspnea, emphysema, pain, allergic rhinitis and cancer, comprises carrier, non-glucocorticoid steroids and anti-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention relates to compositions comprising a carrier, a first active agent comprising non-glucocorticoid steroids or their salts and a second active agent comprising an anti-immunoglobulin B (IgE) antibody effective to treat asthma, chronic obstructive pulmonary disease.

Treducing the probability of or treating asthma and chronic obstructive pulmonary disease. The compositions are useful for centuring the probability of or treating asthma and chronic obstructive pulmonary disease, respiratory, lung/malignant disorder/condition such as asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspnea, emphysema, wheezing, pulmonary disease, cystic fibrosis, dyspnea, emphysema, chronic obstructive pulmonary diseases, cystic fibrosis, dyspnea, emphysema, chronic constructive pulmonary diseases, cystic fibrosis, dyspnea, emphysema, chronic construction, respiratory tract inflammation or allergies, lung surfactant or cappiratory tract inflammation or allergies, lung surfactant or usiquinone depletion, chronic bronchitis, bronchoconstriction, difficult cupiratory distress syndrome, administration, acute creptiratory distress syndrome, administration, acute creptiratory distress syndrome, administration of adenosine or adenosine creptiratory distress syndrome, administration of levels syndrome, pain, and for reducing levels of sensitivity to adenosine or adenosine or adenosine of sensitivity to adenosine or adenosine creptors. The present sequence of sensitivity to adenosine or adenosine used to illustrate the
                                                                                                             Composition used for treating e.g. asthma, chronic obstructive pulmonary disease, cystic fibrosis, dyspnea, emphysema, pain, allergic rhinitis and cancer, comprises carrier, non-glucocorticoid steroids and antimmunoglobulin E antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Mouse monoclonal antibody; murine; surface antigen preSl epitope;
hepatitis B virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100.0%; Score 64; DB 9; Length 114; 100.0%; Pred. It was used as part of a method to improve the affinity of anti-IgB antibodies such as e26 and e27. The e26 and e27 antibodies can be used for reducing or preventing IgB mediated production of histamine in a mammal. They can be used for treating a disorder mediated by IgB such as hypersensitivity, atopic allergy, asthma, allergic rhinitis, conjunctivitis, hay fever, eczema, anaphylactic shock and urticaria. The antibodies can also be used for affinity purification, detection and diagnosis
                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Improving affinity of polypeptides, particularly anti-IgB antibodies - by identifying aspartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the
                                                                                                                                     antibody
                                                                                                                                   The invention relates to a changeable region of mouse monoclonal antibod recognising surface antigen preSI epitope of hepatitis B virus and gene. This sequence relates to a protein encoded by a 357nt DNA of the

It was used as part of a method to improve the affinity of anti-IgB antibodies such as e26 and e27. The e26 and e27 antibodies can be used for reducing or preventing IgB mediated production of histamine in a mammal. They can be used for treating a disorder mediated by IgB such as hypersensitivity, atopic allergy, asthma, allergic rhinitis, conjunctivitis, hay fever, eczema, anaphylactic shock and urticaria. The antibodies can also be used for affinity purification, detection and diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Improving affinity of polypeptides, particularly anti-IgB antibodies - by identifying appartyl residues which undergo isomerisation and substituting alternative residues and screening for affinity against the
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Variable heavy chain; IgB; antibody; anti-IgB; reduction; prevention; histamine; production; hypersensitivity; allergen; anaphylaxis; atopic allergy; asthma; allergic rhinitis; conjunctivitis; hay fever; eczema; anaphylactic shock; urticaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gapa

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 15
```

```
This invention relates to a nucleotide sequence encoding an antibody with improved anti-IgB antibody activity. The antibody has improved action due to a process comprising, a) identifying separtyl residues prone to isomerisation in unimproved anti-IgB (immunoglobulin E) antibody; b) substituting alternative residues to create candidate molecules, and c) selecting those candidate molecules which display affinity against the target molecule. Use of the antibody results in antiathmatic; antiallergic; ophthalmological; dermatological and antiinflammatory activity. The antibodies are useful for treating IgB-mediate disorders such as asthma, allergic rhinitis, conjunctivitis, eczema, urticaria and food allergies. The mutant antibodies produced by the above mentioned nucleic acids may also be used as affinity purification agents and in diagnostic assays for detecting the expression of an antigen of interest in specific cell, tissues or serum. Amino acid sequences AAB76936.

AAB7660 represent fragments of anti-IgB antibodies of the invention.

Polynucleotide sequence AAR69251 represents an expression plasmid used in the generation of affinity improved anti-IgB antibodies
                                                                                            Antibody; antiasthmatic; antiallergic; ophthalmological; dermatological; antiinflammatory; Ig E; immunoglobulin E; asthma; allergic rhinitis; conjunctivitis; eczema; urticaria; food allergy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding anti-immunoglobulin E antibody with improved properties, produced by substituting aspartyl residues in unimproved immunoglobulin E prone to isomerization by other residues by affinity
                                                       Variable heavy chain sequence of MaEll SEQ ID 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Jardieu PM, Lowe J;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 2; Fig 1; 87pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                maturation with phage display
                                                                                                                                                                                                                                                                                                            98US-00109207.
